

U.G. 2nd Semester Examination-2021**MEDIA STUDIES****[HONOURS]****Ability Enhancement Compulsory Course (AECC)****Course Code : MSDH-ENGMAE-AECC(MIL)T-1****[English]**

Full Marks : 20

Time : 1 Hour

*The figures in the right-hand margin indicate marks.**Candidates are required to give their answers in their own words as far as practicable.**Illustrate wherever necessary.*1. Answer any **five** questions of the following:

1×5=5

- a) How is non-verbal communication executed?
- b) What is an acronym? Give two examples.
- c) Write one advantage and one disadvantage of monologue?
- d) What is public speech?
- e) What is Group communication?
- f) State two barriers of communication.
- g) What is an interview? Mention the two key participants of interview.
- h) What is an Inter-personal communication?

*[Turn over]*2. Answer any **one** from the following: 5×1=5

- a) Read the passage below and write a short summary of it:

Gender equality is not only a fundamental human right, but a necessary foundation for a peaceful, prosperous and sustainable world. There has been progress over the last decades: More girls are going to school, fewer girls are forced into early marriage, more women are serving in parliament and positions of leadership, and laws are being reformed to advance gender equality. Despite these gains, many challenges remain: discriminatory laws and social norms remain pervasive, women continue to be underrepresented at all levels of political leadership, and 1 in 5 women and girls between the ages of 15 and 49 report experiencing physical or sexual violence by an intimate partner within a 12-month period. The effects of the COVID-19 pandemic could reverse the limited progress that has been made on gender equality and women's rights. The coronavirus outbreak exacerbates existing inequalities for women and girls across every sphere – from health and the economy, to security and social protection. Women play a

disproportionate role in responding to the virus, including as frontline healthcare workers and carers at home. Women's unpaid care work has increased significantly as a result of school closures and the increased needs of older people. Women are also harder hit by the economic impacts of COVID-19, as they disproportionately work in insecure labour markets. Nearly 60 per cent of women work in the informal economy, which puts them at greater risk of falling into poverty. The pandemic has also led to a steep increase in violence against women and girls. With lockdown measures in place, many women are trapped at home with their abusers, struggling to access services that are suffering from cuts and restrictions. Emerging data shows that, since the outbreak of the pandemic, violence against women and girls – and particularly domestic violence – has intensified.

Women are not only the hardest hit by this pandemic, they are also the backbone of recovery in communities. Putting women and girls at the centre of economies will fundamentally drive better and more sustainable development outcomes for all, support a more

rapid recovery, and place the world back on a footing to achieve the Sustainable Development Goals. UN Women has developed a rapid and targeted response to mitigate the impact of the COVID-19 crisis on women and girls and to ensure that the long-term recovery benefits them. The COVID-19 pandemic provides an opportunity for radical, positive action to redress long-standing inequalities in multiple areas of women's lives, and build a more just and resilient world.

- b) Prepare a public speech of 100-150 words to raise awareness about plastic waste management.
 - c) Write a dialogue between two peers concentrating on the steps one should take in combating the Covid-19 virus during the winter season.
3. Answer any **one** from the following: $10 \times 1 = 10$
- a) Write a letter to the local councilor suggesting him/her to establish a local health clinic to suffice to the needs of the community.
 - b) Write a report on effects of social media on teenagers.

- c) Read the passage below and answer the following questions:

Global climate change has already had observable effects on the environment. Glaciers have shrunk, ice on rivers and lakes is breaking up earlier, plant and animal ranges have shifted and trees are flowering sooner. Effects that scientists had predicted in the past would result from global climate change are now occurring: loss of sea ice, accelerated sea level rise and longer, more intense heat waves. Taken as a whole, the range of published evidence indicates that the net damage costs of climate change are likely to be significant and to increase over time, said- Intergovernmental Panel on Climate Change. Scientists have high confidence that global temperatures will continue to rise for decades to come, largely due to greenhouse gases produced by human activities. The Intergovernmental Panel on Climate Change (IPCC), which includes more than 1,300 scientists from the United States and other countries, forecasts a temperature rise of 2.5 to 10 degrees Fahrenheit over the next century. According to the IPCC, the extent of climate change effects on individual regions

will vary over time and with the ability of different societal and environmental systems to mitigate or adapt to change. The IPCC predicts that increases in global mean temperature of less than 1.8 to 5.4 degrees Fahrenheit (1 to 3 degrees Celsius) above 1990 levels will produce beneficial impacts in some regions and harmful ones in others. Net annual costs will increase over time as global temperatures increase. Some of the long-term effects of global climate change in the United States are as follows, according to the Third and Fourth National Climate Assessment Reports:

Because human-induced warming is superimposed on a naturally varying climate, the temperature rise has not been, and will not be, uniform or smooth across the country or over time. The length of the frost-free season (and the corresponding growing season) has been increasing nationally since the 1980s, with the largest increases occurring in the western United States, affecting ecosystems and agriculture. Across the United States, the growing season is projected to continue to lengthen.

In a future in which heat-trapping gas emissions continue to grow, increases of a month or more in the lengths of the frost-free and growing seasons are projected across most of the U.S. by the end of the century, with slightly smaller increases in the northern Great Plains. The largest increases in the frost-free season (more than eight weeks) are projected for the western U.S., particularly in high elevation and coastal areas. The increases will be considerably smaller if heat-trapping gas emissions are reduced.

- i) What are the observable effects on environment noted due to global climate change? 2
- ii) What is the IPCC and state its prediction? 2
- iii) Mention the long term effects of global climate change in the United States. 3
- iv) Make sentences with any **three** of the following: 3
global, intense, varying, ecosystem, elevation
